

Claim 1: Mosquito fish should be released into our school pond to control mosquitoes.

Claim 2: Visitors to the pond should just use bug spray.

Mosquito fish give birth to up to 100 young. That's a lot of fish that could eat all the mosquito larvae.	Mosquito fish live all over the world, so they would be able to survive in our pond.	Most bug spray is safe to use on young children.
Mosquito fish eat many types of organisms. This makes it so that other animals that eat these organisms like dragonfly nymphs and native fish can't get enough to eat.	Mosquito fish can eat whole populations of mosquito larvae. In fact, an adult mosquito fish can consume its own weight in mosquito larvae every day!	Bug spray protects against mosquitoes that carry West Nile Virus.
Bug spray is known to be very effective in preventing people from getting insect bites.	Bug spray can be dangerous if it gets in the eyes or mouth.	Mosquito fish are harmless creatures who can't harm humans.
